

## Award winning lubricant fights rust with sheeps' wool

Witham Oil and Paint's new environmentally protective lubricant – Prolan – is creating quite a stir in the agricultural industry. The product won the IAgRE Ivel Award for best environmental innovation at LAMMA earlier this year. Suitable for use on metals, wood, rubber and electrical components, it uses lanolin derived from sheep's wool, to provide long-lasting protection through hydrophobic properties to repel moisture and halt corrosion.

Prolan is completely natural, non-toxic and non-carcinogenic and so surpasses other petrochemical products as a safer, environmentally sustainable alternative. It also has NSF certified and approved as a “food-grade lubricant” so can be used to protect machinery in sensitive environments such as dairy farms and suppliers of food chain produce. Lubricants and greases are so widely used in the agricultural world and this new product offers a more sustainable alternative, without the usual harmful chemicals, that also performs with outstanding results.
